How do I go about doing that? ASP.NET is not set as a user in the domain. Do I need to add it to the Domain and then grant the rights?

Thanks for your help.

Did you try following the instructions provided in that error message, and grant permission to the ASP.NET account on your video server?

Northwest Upgrades Plus (donotspam) wrote:

Not sure I understand what this means: If you add network to the

directory

where the application is running that should help with this part of the problem

The program is a web server on another system within my local domain. It is on an XP system, but the IIS is on my SBS 2003 system. When I set the \\videoserver\inetpub\wwwroot\videoinsight is when the error message comes

up. Theoretically it all works as long as I use the URL Forward in IIS, I can see the cameras from my other systems even when using the external address, however this does not work externally because of the IP address being local. All I want to do is have IIS open the web page on the other system. Oh, and yes it is a .net application.

Re: SBS 2003 Standard IIS Issue

Hello Northwest,

What application is it you are trying to run? If you add network to the directory where the application is running that should help with this part of the problem. May also need to add IUSER and I?? (Whatever the other one is??)

Is this Dot Net Nuke or Community Server that you are trying to setup or another application that is failing the initial setup?

The other part of this would be to do pass through with basic firewall to an external IP address. I personally would be somewhat uncomfortable hosting a .Net application publicly on an SBS 2003 standard box and would prefer SBS Premium for this. But again this depends on the application.

Frank Clark

Can anyone tell me what the following message is all about? I am trying to set up a web site that is on another of my internal systems. I can get it to work using an internal IP address, but this will not work publicly. This is the error that is generated when I set the path for the internal system in IIS:

Server Error in '/' Application.

Access to the path
"C:\WINDOWS\Microsoft.NET\Framework\v1.1.4322\Temporary ASP.NET Files\root\928ef48f\fec0b679" is denied.
Description: An unhandled exception occurred during the execution of the current web request. Please review the stack trace for more information about the error and where it originated in the code.

Re: SBS 2003 Standard IIS Issue

Exception Details:

System.UnauthorizedAccessException:

Access to the
path

"C:\WINDOWS\Microsoft.NET\Framework\v1.1.4322\Temporary
ASP.NET
Files\root\928ef48f\fec0b679" is denied.

ASP.NET is not authorized to access the
requested resource. Consider
granting access rights to the resource to the
ASP.NET request
identity. ASP.NET has a base process
identity (typically
{MACHINE}\ASPNET on IIS 5 or Network
Service on IIS 6) that is used if
the application is not impersonating. If the
application is
impersonating via <identity
impersonate="true"/>, the identity will be
the anonymous user (typically
IUSR_MACHINENAME) or the
authenticated
request user.

To grant ASP.NET write access to a file,
right-click the file in
Explorer, choose "Properties" and select the
Security tab. Click "Add"
to add the appropriate user or group.
Highlight the ASP.NET account,
and check the boxes for the desired access.

Source Error:

An unhandled exception was generated
during the execution of the
current web request. Information regarding
the origin and location of
the exception can be identified using the
exception stack trace below.

Stack Trace:

[UnauthorizedAccessException: Access to
the path
"C:\WINDOWS\Microsoft.NET\Framework\v1.1.4322\Temporary
ASP.NET
Files\root\928ef48f\fec0b679" is denied.]
