Here's how to verify that the alert threshold is configured correctly.

<http://blogs.technet.com/sbs/archive/2006/06/07/433707.aspx>

BTW, this is the support blog for SBS, written by the top-level gurus of SBS support at MS, so you might want to bookmark it for future reference.

"John F Kappler" <[johnk@xxxxxxxxxxxxxxxx](mailto:johnk@xxxxxxxxxxxxxxxx)> wrote in message

I'm trying to tidy our SBS system and have finally got round to looking at some of the notifications.

One of these is about store.exe allocating more memory than usual.

I've checked the Threshold and it is set to 157286400.

the 30-day counter average is 604,624,636,16 (why these two numbers can't be presented in the same format is beyond me, but anyway...)

As there seems to be a large disparity I thought I'd better ask if it's appropriate to just up the threshold to something just above the 30-day average?

TIA,

JohnK
