What our very good MVPs are trying to say is in the option for a logon script for the user, create a script to map a network drive. Check out http://www.computerperformance.co.uk/Logon/Logon_HomeDir.htm for an example. This one uses VBScript. Or you can use the NET USE command

NET USE X: \\servername\foldername

have you searched the microsoft knowledge base?
You could search on mapped drives, logon scripts and net use
