I have a client running SBS2003 Premium w/ISA2000 who would like to give access to their web-enabled HVAC controller, which sits on the internal network, to internal and external users to monitor and make changes to the heating and cooling system. I can connect to the controller internally by typing <https://192.168.1.X/start.htm>. I have to use https because the controller has its own certificate. But I haven't been able to publish the server, in ISA, in such a way that I can access it externally. Any thoughts would be greatly appreciated.
