Heck no! There isn't anyone else here but me & the users :)

Interestingly, I am finding the lost rights are specific to certain shared folders; I've been able to reassign rights to the several main folders that people are reporting.

Do you think this could be some kind of error due to the fact I am running the original OEM release of SBS 2003 (not SP1)?

Do you think it might be a very good idea, or a very bad idea, for me to go ahead and apply the SP1 updates? I was planning to do this on Friday anyway...

THanks!!

KB

Did anyone reinstall the domain controller /SBS server?

KB wrote:

Here are two log entries around the time of the server "crash"; could a dump of a shadow copy cause this??

The oldest shadow copy of volume C: was deleted to keep disk space usage for shadow copies of volume C: below the user defined limit.

The computer BUSINESSSYS_DS tried to connect to the server \\PKY1 using the trust relationship established by the LDPI domain. However, the computer lost the correct security identifier (SID) when the domain was reconfigured.
Reestablish the trust relationship.

Can't imagine a scenerio as you describe without substantial events in the event logs.

You probably want to call Microsoft Support for something like this.

To continue here, try running ipconfig/all , netdiag, and dcdiag /c /v on the server and posting the results.

Also, the Administrator cannot access many/most folders on the server, from the server desktop. Access Denied.

Help! I have an SBS 2003 Prem server (OEM version – not yet applied SP1). Suddenly, a bunch of users lost their SID = I had to reassign them a new password to even get them logged in. The Administrator password wasn't being accepted, even at the console. I logged in as an admin–equivalent IT login, and reset the Admin password. Also, some users can't get into sub–folders in network shares.

Re: A couple log entries...

The server apparently crashed and rebooted, but I found nothing in the logs to explain. I don't even know where to begin as their does not appear to be any smoking gun....it's as if something happened to the DC, where some users are messed up, others are not. some can access certain files, others cannot.

I just took over this site two weeks ago and still have not figured out the group policies etc...anyone heard of anything like what I'm experiencing?

Thanks!
