Wow

Where to start.

We are going to go back to the beginning

1. Disjoin your standard Sever form the domain
2. Manually assign your standard server a static IP in the same range as your SBS server. Make the Gateway address on standard sever, the IP address of the SBS Server.
3. Make the DNS Server address on your standard server the IP address of the SBS server. DO NOT add any other DNS servers
4. Get this document.

<http://www.microsoft.com/downloads/details.aspx?FamilyID=6f4015f2-7606-4eaa-828a-00b8df6bd999&displaylan>

Follow the instructions.

I was thinking....maybe....just maybe I needed to have my DNS addresses point to the DC instead of the router, so I changed them, and got this error:

The wizard cannot gain access to the list of domains in the forest.
This condition may be caused by a DNS lookup problem. For more information..... <http://go.microsoft.com/fwlink/?LinkId=5171>

The error is:
The RPC server is unavailable.

I went to that link, but it didn't seem to have any relevant information....I could be wrong though..??

Re: server 2003 standard domain user local rights

Add the 2nd server 2003 as a domain member server and you will then be able to login with domain accounts.
