

Defining printers and setting per client

We have 8 HP laser printers networked that have various input & output bins.

At the moment they are setup individually. EG Invoice printer pickup tray 4 output tray 2 etc.

Our in house data base looks for Invoice printer and sends the jobs.

Each user has a HP8550 as a default printer User1 output tray3 User2 output tray4 etc etc.

Can the server have all the printers installed and allows certain user / group to access certain printers.

The setting up is very tedious. Is there a way to script the above.

Cheers

SteveW
