I've had to modify this for all my clients...including my own SBS which is at R2

Interesting chris because mine does show "localhost" and all works fine for me. We even use
RPC over http so our users can use Outlook from home.

Go to ISA 2004, firewall policy Find the POP3 and go to Properties
Click on the "FROM" tab
I believe it shows only the local host

Add
Internal network

Apply
OK

Then try it

I understand what the SBS Internet Users rule is supposed to do. The user is configuring the POP3 Locally. When I hit send/receive and look at the ISA reporting, it shows blocked by the SBS Internet Users rule.

"SBS 2003 User" wrote:

That cannot be so because the SBS Internet Users rule is to allow unrestricted internet access from internal to external. How did you come to this conclusion? And I am assuming the boss is trying to set this up in outlook internally?
