Have you tried "Domain\Username" ?

"DJ Pomeroy" <[DJPomeroy@xxxxxxxxxxxxxxxxxxxxxxxx](mailto:DJPomeroy@xxxxxxxxxxxxxxxxxxxxxxxx)> wrote in message

I have Windows SBS 2003 with SP1.  
I also have a Dell Axim x51 with 802.11 and bluetooth.

I've been trying to connect my Windows Mobile 5.0 device to the SBS network we have here. I have an AP set up (802.11) and the Mobile gets an IP address directly from the SBS Server. I am also able to browse the Internet using my Mobile device.

I've been trying to use "File Explorer" to get to "\\computername\share". When I try, it keeps asking me for a username, password, and domain. I've tried using the Administrator's username and password and my own (I am a part of the Mobile User Group) and neither work.

Am I doing something wrong?

Thank you for any help you may provide.
