Well, I may have made a little progress.

Redoing the setup, I went onto the laptop and opened the properties for the wireless network.

Normally when I setup windows, I clear the checkbox on the Authentication tab. I checked it, and entered information as I did on the server into the wireless for the laptop.

Now the laptop attempts to authenticate, but I immediately get a notification in the popup area that Windows couldn't find a certificate to use to autenticate the computer..

The certificate does show (named vortex), but on the server side I have two different certificates called vortex as well, with the same valid dates.. so I'm not sure which one to check on the server...

Andy
