Did this work?

FYI, I'm seeing the same issue. The KB did not fix this for me. The sqlvdi.dll was also not in the default location (I found it under C:\Program Files\Microsoft SQL Server\80\Tools\Binn). The KB also indicates that I should "Stop the SQL server". I don't believe the SQL server is actually installed in the default install, but the desktop components are. I'd be curious if you also get this:

Event Type: Error

Event Source: Windows SharePoint Services 2.0

Event Category: None

Event ID: 1000

Description:

#50070: Unable to connect to the database STS_Config on SERVER-03\SharePoint. Check the database connection information and make sure that the database server is running.

This appears to be related to not having SQL installed too. So there seems to be a few event log errors that pop up in the default install if you haven't installed SQL.

Like you my backups seem fine otherwise.

Nick.

I registered sqlvdi.dll as specified by the resolution. The error normally occurs overnight when the scheduled backup runs. I'll post the result tomorrow.

Thanks,
Bruce

Maybe...

Backup fails on a computer that is running Small Business Server 2003

I get an application event log critical error as noted above
with the
description:

certsrv.exe (1092) The backup has been stopped because it
was halted by
the
client or the connection with the client failed.

The backup is a nightly scheduled event that appears to have
completed
successfully.

Does anyone have an idea what's causing this error? If I run
the scheduled
event manually, it completes without logging the 215 error.

Bruce
