I have install a Vista client computer. I go to connect the computer to the domain by entering `http://<domainserver>` and get the page with the four options. I choose connect computer to domain. I get the page with the active x that tells me to start the wizard now. I click that, and get an error message which says I have to be an administrator on the computer (which I presume is the domainserver). I go to the SBS2003 console and add a new user, with the same name as the user on the client computer. I attempt to connect the computer to the domain, in the same way, and get the same error. I don't see anyway to tell it to use the domain user.

So, I create a computer and am told to go back and use the IE interface. Still will not let me connect.

How do we do this with Vista?
