Okay.. I keep trying here!

Each time I get the "user profile marked private" message, I go into the SBSnetsetup.log file to read what is coming up private. As new lines appeared, I went, found that folder and while none were marked private, I shared the folder anyway. BUT... for the last 5 or 6 times, I keep seeing these lines in the log:

```
CProfileList::IsPrivateDir() – returning TRUE for [C:\Documents and Settings\Cheryl\Local Settings\Temporary Internet Files\AntiPhishing]
CProfileList::FindPrivateDir() – returning true [C:\Documents and Settings\Cheryl\Local Settings\Temporary Internet Files\AntiPhishing]
```

NO MATTER how many times I empty the TIF and all offline content, I still get this line. EVEN when the folder or file does NOT EXIST, I still get it. HELP!!!!!!!!!!!!!!

(by the way simple file sharing is disabled)

Thank you for your posting.

According to your post, I understand that you cannot copy profile to domain user profile. If I am off-base on that, please let me know.

Method 1:

First of all, I suggest you disjoin the client workstation from the domain and then use connect computer wizard to join the domain again to migrate the profile.

Also you can use steps provided in the following Kb to copy the old profile for the new user:

How to copy data from a corrupted user profile to a new profile
<http://support.microsoft.com/?id=811151>

RE: Private settings on my laptop

Method 2:

NOTE: Before following these steps, confirm that the "Make this folder private" check box is cleared for the user who you are trying to migrate.

Based on my research, this issue may occur if you do not have permissions to access some of the files that are located in Documents and Settings\UserName folder that corresponds to the user who you are trying to migrate. I suggest that we clear the temporary internet files, perform a clean boot on the problematic client workstation and then test the issue again. To do so:

To clear the temporary internet files:

1. On the problematic client workstation, open IE -> Tools -> Internet Options -> General tab.
2. Click Delete Files button.
3. Tick the box "Delete all offline content" and click OK.
4. Click OK.

To perform clean boot:

- a. Click Start->Run, type "MSCONFIG" (without the quotation marks) and click OK.
- b. In the System Configuration Utility (MSConfig) window, click the "Startup" tab.
- c. Click to clear all the check marks from the list box under "Startup".
- d. Click the Services tab, check the "Hide all Microsoft Services" box and then click the "Disable All" button to disable the non-Microsoft services.
- e. Click OK to close the MSConfig window. Click Yes when you are asked to restart your computer in order to enable the changes.
- f. After restarting, please check whether this issue still exists.

Disabled simple file sharing and set permission on folder to everyone

- a. Open Explorer, click Tools->Folder Options, click View tap, ensure do not tick Use simple file sharing (Recommended)
- b. Right-click Documents and Settings\UserName folder select properties, click Security tap
- c. Add Everyone in user list, tick Modify permission for Everyone, click OK to finish.

Additional, you have mentioned Files and Settings Transfer Wizard, there is a KB you can follow:

How to use Files and Settings Transfer Wizard in Windows XP

RE: Private settings on my laptop

<http://support.microsoft.com/?id=293118>

If the issue still exists, please provide me with the following log files:

1. When the error message occurs, press PrScrn key, paste in MSPAINT application, save the screen shot file and email to me.
2. Email me with the C:\Program Files\Microsoft Windows Small Business Server\Clients\SBSNetSetup.log file from the affected client computer.

You can send the files to me at v-terliu@xxxxxxxxxxxxxxx

Have a nice day!

Best regards,

Terence Liu(MSFT)

| We just set up SBS 2003 R1 as our server and added users & computers.

| One workstation is added and working fine internally (remotely is a
| different story and the subject of a separate question!).

| Mine however, is not. I stupidly did not migrate my profile over when I
| connected the computer to the server (one too many multi-tasking
| processes
| going on at once!) but I'm trying to fix that.

| Here's my problem!

| I completed the transfer files & settings wizard and saved the file in
| "My
| Documents"; I told the server redirect all "my documents" to the server;
| but
| when I try to migrate my files over to the server and to access my
| transfer
| files & settings wizard I get a message that the files are private.

| I have tried following all the instructions (including the 886210
| suggestion) to make my files, folder, profiles, documents & settings,
| EVERYTHING NOT private on my laptop but all to no avail.

| I'm pretty frustrated and decided to call out for help.

| HELP!

| Thanks
