I have a remote back-up site with an SBS 2003 "front end" and a set of 8 Dell blades (separate domain). Right now operators have to daisy-chain in to remote desktops, first to the SBS then to the individual blades.

Any way to get the blades on the Remote Web Workplace "Computers" screen at [https://\(sbs-server-address\)/Remote/Default.aspx](https://(sbs-server-address)/Remote/Default.aspx) ?

Thanks
