In article <1169509325.348152.15660@xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx>, dliberty@xxxxxxx says...

Hi,

I am running an SBS 2003 with ISA 2004 server. I need to set up a site-to-site tunnel to a 3rd party office.

Now basically, this is not really site-to-site because the only communication needed here is for our SBS server to access an FTP on their network securely (they insist it be done with an IPsec tunnel). Usually I would have done this without a problem using ISA, but here's where it gets complicated:

My SBS server's IP is 192.168.16.2. The 3rd party office which I'm trying to create the tunnel with claim they cannot setup the tunnel since they already have someone else tunneled in with with this IP (192.168.16.2).

So at first I thought I'll try to set up an additional IP address on our Internal NIC which is "available" to use on their side, but this doesn't work since when trying to access their server the source IP is still 192.168.16.2.

I have also tried changing the IP address of my Internal NIC but this caused about 50% of the services running on the server to hang/stop functioning and so I consider this to be the worst case solution.

I'd go with that – regardless – should come right if you re-run the wiz.
