Well now with DHCP on SBS, type ipconfig/all at a dos prompt (on the server) and post the result.

Thanks for the Quick response.

I took the DHCP off of the router, installed DHCP, set up a scope, and hoped

for the best. Unfortunately within 20 mins I was back restarting the DNS server. Then, just to make sure I rebooted; no change.

Any Recommended settings for the DHCP config that might help? I just used what came as a default set (like, nothing).

"kj" wrote:

Get DHCP off the router and on to SBS. Likely this will fix your DNS problems ( and a lot more you probably are not aware of yet).

Several times a day, I need to restart the DNS server on my SBS2003 box. I find that my mail does not go out, and then see if I can get out with IE, and that fails. I restart the DNS server and I'm fine for a while. Intersting

Re: DNS Server on SBS 2003 Stops working

that in the applet, the DNS server shows as started. BTW, in the

Exchange

System Manager, I then need to go to the queues and force connection to

get

the mail out after the restart. The only error I can find is the following:

Event Type: Information

Event Source: DNS

Event Category: None

Event ID: 113

Date: 1/25/2007

Time: 7:59:58 AM

User: N/A

Computer: BCSSRVR

Description:

The DNS server could not signal the service "NAT". The error was 1168.

There

may be interoperability problems between the DNS service and this service.

I can access the internet from other workstations. I am running DHCP

off

the

router (Netopia 3386 ENT). Mail continues to come in.

When I restart the DNS Server, it may work for 1 minute,

5,10 an hour,

half

a day. Who knows. I spend a lot of time logging in to send mail to my

Gmail

account to see if my mail is going out!

Help, please!!
