I cannot say for certain. He has been bringing CDs in and out of the company.

Forgetting about the fact that he has installed 3 different versions of SQL for a moment, he insists that he installs SBS this way on an ongoing basis.

I really do not understand why I cannot see the new server in MS Windows Network and have to search for a computer using its IP address.

I asked him about the server not being a DNC and he is evasive and says that the server would have crashed many times if the install wasn't complete.

My partner and I have a definite distrust of him and we are stuck between the client and this vendor and the client feels stuck between the vendor and us.

To be honest, one of my concerns is that I may be overreacting and perhaps everything will run fine, my SQL accounting application will OK, etc. At this point, I do not know what to think.

Do you know if the vender installed SBS 2003 R2? If it was R2 then SQL 2005 Workgroup Edition is what comes with that release of SBS 2003. I don't know for sure how you would go about getting SQL 2000 that would be licensed as being part of SBS 2003 R2 Premium. Maybe someone here could shed more light on that.

Re: Why setup two servers with same name

I know he purchased SBS 2003 Standard initially.
A couple of weeks after that I noticed the first CD from SBS 2003 Premium.
He charged my client \$800 (CDN) being the difference.
Over and above everything else we (the client and my company) also think that there is a communication problem due to primary language difference.
My company also thinks that there is a competence issue and lack of integrity.
I think that the client also agrees with the last two assessments but I hesitate to ask them.
My opinion is that there are also some 'irregularities' but I really do not know if it is a good idea to post the observations.

I would also confirm exactly what the vendor selling/installing the server OS purchased for this client. Did he purchase SBS 2003 standard and then purchase SQL 2005 as a separate application thus needing extra licensing or did he purchase SBS 2003 premium but didn't know that he had to install SQL from the Premium Technologies disk. It would seem the bill from this vendor is edging upwards as time passes!

Re: Why setup two servers with same name

typed:

To make matters worse:
I quoted on SBS 2003 Premium since we need SQL 2000 Premium with the GUI.
The other vendor quoted 'SBS 2003' on his offer.
When we went on-site to migrate our accounting app. we noticed that the SQL Enterprise Manager was missing.
The consultant had installed SBS 2003 Standard.
We spoke to client and other vendor and said specifically that we needed SQL 2000 Premium.
The other vendor then

Re: Why setup two servers with same name

installs SBS
2003
Premium
with SQL
2005
Premium
(not 2000).
I do not
know
exactly
what steps
he followed.
We
complain
again and
he finally
installs SQL
2000
Premium on
the
third try.
Again, I do
not know
exactly
what he did.
I am
worried that
the server
might also
be
'confused'
because the
consultant
is not
trustworthy
and is being
vague.

I strongly suggest you
flatten & reinstall....and get
all workstations
on
W2k/WinXP Pro.
