This is a fresh install of the OS.

The only out of the ordinary thing that I can think of is the CompanyWeb has been upgraded to SQL 2005 for search capabilities.

SBS updates for Vista are applied.

ISA is 100% and up to date for Vista.

Vista clients are running with no issues, as are XP.

Issue is with the Monitoring and Reports. I have run the setup several times using different options and nothing seems to change.

Report window says: No Performance data is available at this time.

Performance data is collected hourly.

It has been a while since the setup for reports has been done. Still nothing.

Both SQL\$SBSMonitoring and its agent are up and running.

When I reinstall the reporting component I get a non-descript error twice:

WinMgmt ID 5603

A provider, PerfProv, has been registered in the WMI namespace, ROOT\CIMV2\MicrosoftHealthMonitor\PerfMon, but did not specify the HostingModel property. This provider will be run using the LocalSystem account. This account is privileged and the provider may cause a security violation if it does not correctly impersonate user requests. Ensure that provider has been reviewed for security behavior and update the HostingModel property of the provider registration to an account with the least privileges possible for the required functionality.

Re: SBS R2 Premium – Monitoring & Reports Broken.

That is it!

I would like to get the reports going!

Thanks for your help...
