In article <774B2590-C99C-4677-AF83-E546F8DA3EC6@xxxxxxxxxxxxxxxx>, Kevin@xxxxxxxxxxxxxxxxxxxxxxxxxxxx says...

Hi Everyone! My SBS 2003 is having this really odd issue with the one of the GPO's for the Default Domain Controller Security Settings and need help fast.

The "Local Policies/User Rights Assignment" > "Access this computer from the network" the setting should have a list of users but it does not. I add the list of default users that should be allowed and everything works fine, but after 5 or less minutes the system security removes them again.

I've spent days looking for answers to this problem without finding a reason this is happening on the server. I do see in my event logs that they server is removing all the users but dont know why. Can anyone help?

Here is a screen capture on what is happening.  
<http://www.digitaldose.com/photos/gpo/>

Based on the screen shots ... are you modifying the local policy using secpol.msc? If so, it's being overridden by the SBS Default Domain Controllers Policy GPO. (GPOs are reapplied every 5 minutes on Domain Controllers and every 90 minutes on other computers in the domain.)

If you need to change the setting, you will need to change the GPO using the Group Policy Editor.

Another possibility is that another GPO (such as Default Domain Policy) is overriding the Default Domain Controllers Policy.

You can use the Group Policy Results Wizard in Group Policy Management to see what is causing particular settings.
