Hi compsonic,

Member server would be the correct choice, and it will be a file server.

Many of your questions will be answered in this document:

<http://www.microsoft.com/downloads/details.aspx?FamilyID=6f4015f2-7606-4eaa-828a-00b8df6bd999&displaylan>

But there are some differences between SBS 2k and SBS 2k3. You might be able to find a similar document for SBS2k, or perhaps try the SBS2k newsgroup.

We are running SBS2000 Server on 1 box. We added a second box with Windows 2003 Server R2 and joined it to the domain. We have a couple questions:

1. Concerning the role of this server: The primary & only purpose of adding this server is that a MRP software package that runs a PervasiveSQL-based application will soon be installed on this server. All current clients on the SBS2000 domain need to access this application. There will be a separate client install on each of the workstations.

Question: We thought we would be assigning "Application Server" as a role, but when we went to do that, it describes this role as meant for "build, deploy XML Web, etc. So we instead chose to assign it as a "File Server". Is this correct?

Question: We often see these types of server additions referred to as "Member Servers". Is that a specific setting, assignment ? And if so, where do we set that up—on the SBS box or on this new Server?

Re: Adding Windows 2003 Server to SBS 2000 Domain

2. Concerning Licensing: We understand that we have to add the same number of client licenses that are on the SBS box to this server. How do we specifically do that???

Thanks
