Hello all!

Windows 2003SBS R2 installed with ISA (Multihomed)
When we use the "nltest /dsgetdc" on that server, it returns the correct domain controller but it shows the wrong IP address. The IP address indicated is for the outside NIC (public) IP .
The question again is: Where does this setting come from. Is it stored information from DNS records or other AD setting?
We do need to correct this to make the Global Catalog available.

Your input is greatly appreciated

Stefan

below is a edited screen print from the command:
DC : \\server.domain.local
Address : \\61.250.0.0 <- this is the external
address and should reflect the internal address.
Domain Guid : {920EAE98-DE5A-4741-8319-AD1A6DB8136E}
Domain Name : xyz.local
Forest Name : xyz.local
DC Site Name : Default-First-Site-Name
Our Site Name : Default-First-Site-Name
