Hi Neil,

While I've never had occasion to do this, I believe you can first run the SBS Backup Wizard, then open NTBackup | Backup tab | Load Selections and Browse/Select the .bks location (C:\Program Files\Microsoft Windows Small Business Server\Backup\Small Business Backup Script.bks). Then on the menu, Tools | Options | Backup Type. Then change the type from Normal to Copy and save the .bks file.

I have a client (Medical Practice) that requires the "SBS Backup Job" available through the System Manager, to be able to perform the backup using mode "copy" instead of normal as we do not want to reset archive bits. This is because we have in place an 'Offsite / Online' Backup solution that dynamically updates changes to data files in selected folders. I schedule this facility to shutdown for two hours each evening so that the server can do a full system backup, but when I start the offsite facility again, the SBS Backup has changed the archive bits to indicate the files have been backed up, thus the offsite facility will not detect any file changes for that day. How can I modify the automated facility to do a "copy" mode type backup?

Thanks for your Help,

Neil Horley,
