Hi Jacky

Thanks for that. The remote users access emails straight into their outlooks from our company domain web host. There are separate mailboxes with the web host for them. We just want them to be part of the distribution list and making them change their work style by connecting via vpn first which they currently don't do seems a bit much.

I am interested to know why contacts can not have external emails addresses in the same company public domain as the rest of the users. If it were possible it would make it very easy for us to achieve the company wide distribution list.

Thanks

Regards

Hi John,

Thanks for posting back.

I am glad to hear it works for the purpose of testing,for your another question,why do you use contact for mail delivery? if you need forward to an external email address,you can use the contact, so can you just use the normal user account for the employees at remote site? and please let me know how the employees at remote site access their mail,I think they can use RWW to do that,or by VPN

Have a nice day!

Best regards,
