Is there a way to decrease the time that the POP3 Connector checks for email?

Thanks.

I found the following instructions at

<http://www.serverforumz.com/POP3-connector-make-check-frequently-15-minutes-ftopic46337.html>

but haven't tried them out:

1. Locate and then click the following registry subkey:

"HKEY\_LOCAL\_MACHINE\SOFTWARE\Microsoft\SmallBusinessServer\Network\POP3 Connector"

2. On the "Edit" menu, point to "New", and then click "DWORD Value".

3. Type "ScheduleAccelerator" (without the quotation marks) as the entry name, and then press ENTER.

5. On the "Edit" menu, click "Modify".

6. In the "Value data" box, type the value that you want, and then click "OK". To determine the polling interval, the value that is configured on the "Scheduling" tab in the GUI is divided by the value that you type for the ScheduleAccelerator entry. For example, if a 15 minute interval is specified in the GUI and you set the value of the ScheduleAccelerator entry to 3, the connector will poll ever five minutes.

7. Quit Registry Editor

Re: POP3 Schedule

PS: it took me about 60 seconds to find this info using google, maybe you should try it sometime.
