I created a group of computers in ISA that I called "x64 computers". Designated by IP address range. I then created a rule that gave them full access. Finally, I used DHCP reservations to make sure that my x64 computers were in that range.

Hi Charlie,

Thanks for the reply. I disabled the RPC filter but it didn't change anything about the symptoms. What kind of custom ISA rule are you suggesting I create?

Stuart

Disable the RPC Filter until you're joined to the domain. And if worse comes to worse, give your XP x64 client a DHCP reservation, and then create a custom ISA rule for that client IP address.
