The Comcast residential TOS prohibits servers at all so even if you can use their mail servers as a Smart Host you'd be violating the TOS.

And, it can even happen with a static IP. Blacklists have very long memories. One of our SBS sites had to get a new Verizon IP, in a different range, because the old one "use to be in a pool of dynamic ip's" when that range was owned by AllTell.

I have no direct experience with this, but perhaps it would work using this setup if Comcast would let you use their servers as a "SmartHost".

A Comcast residential account has a dynamic IP and there are many blacklists used by receiving mail servers that won't allow messages originating from those IP addresses. If this is truly for a business it would be better to get a service that provides a static IP.

Actually, it was just using the reply within a craigslist posting, surely they allow you to reply to themselves.

Looks like it to me that the recipient's mail server rejected it.

Probably because of the subject line which can be filtered as being SPAM.
