Hello:

If you go to [www.eventid.net](http://www.eventid.net) there are a number of suggestions for these error messages. Most of them seem to do with network connectivity.

Problems can be related to network cards/driver, cabling, and more.

I suggest you have a look at those suggestions. :-)

Hi there,

We have been having some issues with a network drive. The scenario we have is the one that follows:

- 1 Server Windows Server SBS 2003: DNS, AD, DHCP, Exchange (No ISA server)
- 10 Windows XP SP2 clients.

We have a shared folder on the server (\\server\public\ ) which is connected to all the clients via a network drive (P:)

The problem is that, from time to time and without any warning, when the users access the drive it is displayed as if it was empty. At the same time a different user might be working with it correctly and also the rest of the server's resources are available and work fine.

It can happen one day to one user and never happen again for two or three days.

No errors on the server's event log but two on the client's one that could be the case: USERENV 1054 and NETLOGON 5719

Re: Empty Network Drive

We have checked DNS and NIC configuration either in the server and the clients and everything is set up correctly.

It's not a big deal but the one that has more problems is the manager's one, you know what that means...

Any clue? Thank you.

.
