Is there a chance that the XP users IP address range at the remote location matches the internal IP range for the SBS network?

Hi

I am trying to set up a VPN for our sales guys working from home.

Server = Windows 2003 SBS with 2 wire 1800hg firewall 8mb connection via bt (worst luck). Single network card only. Static ip address assigned to the router but internal ip address to the server (normal?). Port forwarding on the router via pptp server.

Client= Windows XP 2mb broadband from home.

Been through the setup and found the usual issues with firewall ports and protocols etc.

I can get the VPN to authorise and connect me but once I have been connected

I cannot view any folders or files on my normal mapped drives. I assume that the logon script does not run over a VPN or if you can run it how do you do

Re: VPN XP to SBS 2003 Connects ok but no files or folders displayed

it.

I have full administration rights to the server so it is not a permissions problem. I can also connect via remote desktop.

This is really annoying me now, either i'm missing something simple or i'm just plain stupid!

Any help much appreciated.

I think I covered all the necessary info but please advise if any further required.

Regards,

Ian Jones
