How do I enable IP routing?

I just went into Routing and Remote Access, went to my server, went to NAT/Basic Firewall, chose my External NIC, and it's selected as public interface with access to the internet, using NAT and basic firewall. I have a firewall (the PIX) so can I just turn this off?

I went to the services and ports tab, selected VPN Gateway (IPsec/IKE) and entered in my internal NIC address (192.168.1.2).

When I connect to the VPN now, I still can't ping my external NIC or my internal NIC.
