Hello Terence,

You almost – but not quite – got the gist of my problem/question:

"Can I use Outlook 2003 from SBS2003 on computer that I have not joined to the domain?"

- a) I \*don't\* want to join this (and other similiar) computers to the domain.
- b) In this case the OS is non-supported for joining to domains anyway (XP Media Ed), and no, I cannot reinstall the OS for the work-around.
- c) These are private contractor's personal PC's which will come and go, usually only for a few months. But while they are here, we want to give them access to our Exchange server, using Outlook (not OE or other lightweight email client), because of scheduling (calendar) and tasks sharing/tracking. (Big reason why we purchased SBS2003).

Given that I have a CD, one would assume (silly me) that I can install Outlook 'stand-alone' anytime I want that device to connect to our Exchange server.

As long as I do not exceed my CALs limit, I would hope that this is OK|legal|possible. In reviewing the forum here, I found various posts that attempt to deal with the licensing issues – from what I've read, what I'm trying to do should be OK?

Are you saying that I \*must\* join computers to the domain in order to comply with the licensing requirements of SBS2003?

Thanks.

Hello Customer,

Thank you for posting here.

According to your description, I understand that you want to access SBS

Re: Use Outlook 2003 from SBS2003 \\servername\ClientApps\outlook2003

share folder to install Outlook 2003 for a computer which does not join in SBS domain. If I have misunderstood the problem, please don't hesitate to let me know.

Based on my research, the Outlook installation file in the SBS share folder is integrated with SBS. You buy it together with the SBS. And the SBS only support the computer which joins in the domain to install the Outlook. If the computer does not join domain, the prompt to input product key is by-design. And this behave will break license.

When the computer join domain, the computer name will apply in the Server Management console->Standard Management->Client Computers.

If you want to install the Outlook 2003 on the computer which join domain, please use the Assign Applications Wizard, but not access the share folder on SBS.

I suggest we perform the following steps to install Outlook 2003 on client computer, it will no need to input product key:

1. On the computer, access <http://SBSname/connectcomputer>, finish the ConnectComputer wizard to join the computer in SBS domain.
2. Open Management console->Standard Management->Client Computers, click Assign Applications to Client Computers link in right pane
3. In the Assign Applications Wizard, click Next, select the computer join domain in step1, click Add, click Next,
4. Tick Microsoft Office Outlook 2003, click next.
5. Then finish the wizard,
6. Restart the client computer, then, you will get prompt to install Outlook 2003.

Hope these steps will give you some help.

Thanks and have a nice day!

Best regards,

Terence Liu(MSFT)
