IMF supports the IP Accept list. However there is no sender based whitelist which is normally the most required.

For blocking spam you could use the built-in Sender Filtering, Recipient Filtering or the IP Block List under Connection Filtering.

If I understand right from previous posts, with IMF there is not white list,
so if I want to filter advertasing for exemple I will need to build a blacklist.

Re: filter for spam with pop3 service

IMF doesn't work in that scenario. The SBS POP3 connector bypasses the IMF.

Do you mean you are using the SBS POP3 connector to download emails from an ISP?

What about using IMF as an additional filtering layer? This is how to do it:

<http://www.exchangeinbox.com/articles/040/pop3imf.htm>

Hello,

I had a look in all the questions but I didn't find any answer to my problem.

So here it is, I use POP3 service to get my emails, I already have an external service of spam protection but I still get some spam and a lot of ad.

In our system many persons

Re: filter for spam with pop3 service

get all the emails through a distribution list, that is why the unwanted emails are bothering us.

In my outlook 2003 I have create a rule that check every email that I receive and if the contact is not in my contact list it goes to the junk email. I just have to check the junk file and to update my contact list if needed.

What I wanted is to do this before the distribution of email, in that way we will centralize the junk email and everybody will get only good emails.

I would like to use a contact list and a junk file in the public folder (so everyone can update and check).

Can someone help me with this.

Thanks.
