The only reason I've found for scheduled scans is the chance that you have some malware which was not detected by the current patterns when you saved the file, but a newer pattern now detects it. Not very likely I think, but possible. I agree with the original poster that it would be nice if there were an easy way to see the scheduled scan results in Trend Micro. I've tried looking at log queries/reports, but it's not easy to find.

I believe you can do a log query, and you can also generate reports with the same information.

However, I don't believe in scheduled scans. Real-Time scanning means files are scanned on all read/writes. If real-time scanning can't do the job, I don't want the product.

Manual scans are fine, there are sometimes good reasons to kick off a scan manual scan – but that's different from a scheduled scan.

But I could be missing something, so feel free to change my mind.

A while back I switched two clients to TrendMicro SBS package. That was before I found out that there is absolutely no indication that a sheduled scan has run (unless it reports a virus). I think it's essential to have some visibility when the scan starts, when it ends to verify that it is indeed running on all pc's. It's just to easy for a pc to have a problem with running the scheduled job and you never find out because there is no

Re: Antivirus Recommendations?

TrendMicro log of the normal runs and there doesn't appear to be anything in the system event logs. I won't be recommending this product because you just don't know if the scheduled job ran during the night.

Aw, another happy McAfee Customer. (Notice the sarcasm?)
Sorry been
Screwed
too many times..

Try this
<http://www.trendmicro.com/en/products/suites/csm-smb-suite/evaluate/overview.htm>

Cheaper also.

Having had good luck with McAfee's Enterprise antivirus using EPO3.5 repository, Groupwise Exchange product and enterprise desktop on our SBS2000 system, we ordered and new Server, SBS2003 and McAfees new Active Viruse Defense for SBS. As soon as the server was loaded and running I installed SP1, then called McAfee for assistance installing the protection pilot V1.0.1 as the SQL MSDB would not install. The tech talked me through an alternative solution to get it working. The desktops all pushed out fine, but I started

Re: Antivirus Recommendations?

logging DCOM errors in the applicaion log.
Instructions on MS site
didnt clear them up so I called McAfee.

I was told I have two choices: uninstall
proteciton pilot (the system
that
monitors, pushes out installations/updates
and reports on all activity
or
uninstall SBS2003 SP1. They say they
would be compliant with SP1
until
sometime after the first of the year....

Anyone have experience with a similar
product for the server, exchange
and desktops that automates the management
tha works with SP1?
