Running SBS 2003 Premium SP2.

=====

I was re-reading Microsoft's whitepaper "Securing Your Windows Small Business Server 2003 Network" and got to the page about SQL. Not having looked at it in awhile, I looked at Enterprise Manager, then Control Panel > Add/Remove Programs to see what I've got before I download anything as an "update". Problem is that I can't tell which SP's have been applied or not. I've had WSUS running for the better part of a year, but how can I check to see if my SQL 2000 is current with all updates?

(Please forgive me if this is a newbie question, for I certainly am one in this area.)
