Have you dropped the users back to workgroup and then re-joined the users to the domain ?  
( the users will need to pick up the new Account SIDs – which means that they will get new profiles too... )

Just purchased new server hardware and have reinstalled sbs using the same domain name and user accounts. Thought I would start from scratch seeing as had some problems with some of the user accounts on old server.

Well now the roaming profiles and my documents redirection do not work with Domain Users, but do with Domain Admins?

I have used xcacls and subinacl to make sure all securities are set and have set all the sharing and securities the same as old server settings.

Why are Domain Users not working?

Thanks in advance to anyone who can help.

Ben
