To access our SBS web access and remote workplace I give my users a link off our website for easy access. They click a "mail" link on our website (not hosted w/SBS) which takes them to another page that is set to automatically redirect to the webmail or remote address on the sever (IP.IP.IP.IP/exchange or IP.IP.IP.IP/remote).

The problem is that Internet Explorer warns of an changed or unknown security certificate upon the transfer from the redirect page. Is there any way to prevent the security certificate error without lowering the security prompts on each users Internet Explorer?

.
