Well, I have not figured it out yet, but I have narrowed it. The client machine has a local instance of SQL Server 2005 installed for testing purposes. I turned off all services related to it and the problem stopped. I guess now all I have to do is turn one on at time until I find the culprit. The confusing thing is that none of those services were running under the client user account. I don't know why any of them would be sending login request under the client user account.

"Jody" wrote:

Hello.

After shortly logging into the domain with a particular domain user account, it begins to generate a flood of event 675 errors on the SBS 2003 server and 529 and 539 on the client machine (Windows XP). Eventually the account threshold is passed and the account will lockout. This happened right after I changed the password for the account. According to the logs the bad username/password is coming from the client machine. I checked all the services on the client machine and none of them are configured to run under that user account. I even changed the password back to the original and the problem continued.

Below are the log errors that I am receiving:

On Domain Controller:

Event 675

Pre-authentication failed:

User Name: xxxx

User ID: xxxxxxx\xxxxx

Service Name: krbtgt/xxxxx

Pre-Authentication Type: 0x2

Failure Code: 0x18

RE: account being locked out shortly after login Events 675, 529, 539

Client Address: xxx.xxx.xxx.xx

On local machine events:

Event 529

Logon Failure:

Reason: Unknown user name or bad password

User Name: XXXX

Domain: XXXXX

Logon Type: 2

Logon Process: Advapi

Authentication Package: Negotiate

Workstation Name: XXXXXXXXXXXX

Event 539

Logon Failure:

Reason: Account locked out

User Name: XXXX

Domain: XXXXX

Logon Type: 2

Logon Process: Advapi

Authentication Package: Negotiate

Workstation Name: XXXXXXXXXXXX

Thank you,
