Not at all... we back up our data every night – However, restoring an image of the system partition is, I'm guessing, very much faster than a re-install and restoring the data from tape.

Would you happen to know if deleting the log files will work?

Richard

Are you saying your most recent backup is this 5 week old image ?

5 weeks ago I created an image of our SBS 2003 Standard SP2 R2.

Drive C has the operating system  
Drive D has the Exchange MDBData directory.

Would I be right in thinking that if I restore Drive C and delete the log files in the MDBDate directory all will be well with Exchange?

Many thanks

Richard
