Hello All,

I have an SBS2003 Server and I upgraded to Sharepoint 3.0. the upgrade was fine. I need to know how to configure my new share point site to be accessed via a name i.e. (http:\\newsite) like the old companyweb site was. I have to now have to type in the full name (i.e. http:\\servername:port/sites\\intranet\\default.aspx)

Any Help is appreciated

Thank you and Be Blessed
