You should install SBS 2003 SP1 at least as SP 0 is no longer supported and upgrade ISA to 2004 . You've applied the ripcurl patch and other necessary items in the KB article and added the Vista via the connectcomputer wizard?

It seems there are a lot of issues around with vista and network connections....

Here is my scenario.

SBS 2003 Premium (no sp)
XP Pro clients
Vista Clients

XP Pro clients have no issues in the network setting.

From a new install of Vista clients work fine (obtain IP from DHCP) when connected to the internet router directly.

Connect to the SBS Server and DHCP assigned IP address is also obtained.

Client can be added to the DOMAIN. It appears that this works fine initially

and connection to the internet can be obtained throught the SBS server / ISA

Server.

HOWEVER....

Reboot the clients and they are no longer able to obtain IP address from any DHCP server.

I have tried to clear the winsock settings as posted in a previous reply.

I have uncleared the BROADCAST flag.

I have read elsewhere that the GPO for the Domain may have caused problems but cannot find a solution to clearing this.

I can set up manual IP Addresses but the default gateway seems to have issues (cannot find a solution to this either). This manifests itself when

Re: Vista Dhcp SBS 2003

using Windows Live Messenger (internet works fine).

Outcome required.... Ability to clear DHCP issues and obtain DHCP assigned IP address

or.....

Manually setup IP so that the Default Gateway works correctly

Thanks in advance.
