Bill, many thanks for your reply, I will have a go within the hour and respond with results. And yes i do run ISA 2004 and will follow your instructions.

In all, this newsgroup is very educating!

Regards
Henrik

Hi Henrik,

Here's the plan:

1. Create another web site in your IIS.
2. When doing so, configure it to use a host header (such as www.thatname.com) and listen on port 80.
3. Migrate the original www.thatname.com to your SBS Server.
4. Configure authentication for your newly created web site.

Now, ask your ISP to point www.thatname.com to your SBS Public IP address, and everything shall be fine.

CAUTION: Do you have ISA Server installed? If yes, please do not configure the A record now, since you must configure a Web Publishing Rule first.

Hope this helps.

Sincerely,

Bill Peng

Re: IIS web config

The public newsgroup only focuses on SBS related technical issues, for other Microsoft products, we recommend you to post to appropriate newsgroup

to get most qualified responses.

<http://www.microsoft.com/communities/newsgroups/en-us/default.aspx>

When opening a new thread via the web interface, we recommend you check the

"Notify me of replies" box to receive notification. When responding to posts via your newsreader, please "Reply to Group" so that others may learn

and benefit from your issue.

Microsoft engineers can only focus on one issue per thread. Although we provide other information for your reference, we recommend you post different incidents in different threads to keep the thread clean. In doing

so, it will ensure your issues are resolved in a timely manner.

For urgent issues, you may want to contact Microsoft PSS directly. Please check <http://support.microsoft.com> for regional support phone numbers.

Any input or comments in this thread are highly appreciated.

Thanks for your reply Larry,

I do agree with you and others that say that you shouldn't host your website

yourself, use an ISP. In the case with my own default web, it's not a prod site, my own prod site is hosted by an ISP. The default web is right now used

by myname.com and is a FQDN that's not in use for prod issues.

However, the FQDN thatname.com is a prod domain name. But the most important

need I have is a logon situation for certain files in the FQDN thatname.com

which my ISP can't provide and I can't web code a solution for.

Regards
Henrik

Henrik:

Most here would say that to host your own web site is a bad move. Too many attacks through port 80, and not enough bandwidth or power protection.

IMHO, you would do better to work this out with a hosting company where the web sites can link to each other without involving your SBS server.

Re: IIS web config

Hi, I need help with following (are a complete nuub on web site config).

(Have a sbs2003 sp1 r2)

Goals

- 1) Use a web with www.thatname.com located at my ISP. All done!
- 2) On the website above, use a link, pointing to www.myweb.com, located on my web server (default website).
- 3) On www.myweb.com I want to have a url like www.myweb.com/thatname

that

the above link under 2) point to.

- 4) When clicking on the link above, getting prompted for a username and password.

Alternatives.

I already using one public FQDN on my server, I can move the site thatname.com from the ISP to my server and create a completly new

website

for FQDN thatname.com on my SBS2003
OR create a website or virtual

site

under my own myname.com.

Questions.

1. How do I do this right?
2. Create a new website or a new virtual site that has files that Im linking to?
3. How do I config my DNS? On the DNS on the ISP side I cannot config parts of my FQDN after the domain name root (in my case irl.se) (Ex. www.myname.com only not for urls like www.myname.com/thatname)(I am probably as stupid with DNS knowledge...)(config with sub domains with

Re: IIS web config

my

FQDN myname.com works fine such as
huddinge.myname.com)?

4. When done with above, how do I
configure ISA to publish my new site,
use one of the existing rules?

5. How do I configure the chosen website for
prompting of the username
and password of my choice?

If its easier to host the whole domainname
that today is hosted at the
ISP, how do I config my server with the
same goals as above?

How do I add a second FQDN so I can host
websites other than my own and
use multiple domainnames within Exchange
etc etc?

I do hope some good soul can give me some
of his time answering my
questions.

I would be very grateful.

Thanks for anytime given to my needs :-)

Henrik
