Thanks for pointing out that xp and vista support ipsec vpn connections natively. I didn't know that, I guess.

I think I found a solution to go around what I was originally try to accomplish by using ipsec. To fill in the missing details however, I should say that I had a hardware firewall that offered ipsec server functions, but had user workstations behind small home-class routers that I wanted to connect up to the hardware firewall. I am going to bypass this entirely now at this time. But thanks so much for your help!

Sincerely,  
Joe.

Like don't they do it natively?

For like what? Can you be more specific?

I am wondering if anyone knows of a free ipsec client that can be installed on an xp/vista client workstation.

Thanks!  
Joe
