Hi George:

The \*usual\* cause of long startups is DNS. Can you verify that all systems point to your SBS internal nic and that it has your ISP's DNS settings in its forwarders tab of DNS?

1 - 2 mb in roaming profiles should not cause such a long start.

Were all the computers joined to the domain with connectcomputer?

Larry

Dear all,

I recently installed Win2003 SBS premium edition with 15 users and 10 client machines . roaming profiles is enabled for all user . after enabling some group policy restriction i noticed that when a user logs in take nearly 3 to 5 minutes for users to log into windows XP.

Is this delay happening because of group policy restriction or because too many users are logging into client machines with bigsize roaming profiles . i noticed that each client roaming profiles is around 2 mb .

is there a way to get the roaming profiles cleared off from the local machines once the user logs off

Thanks  
George
