Hi,

Know this is a very slim chance for rectification but I like to ask before I give up.

Server on RAID0, due to space problem, need to seek other way to add extra spaces to the OS drive. One lucky thing is I do have a spare server which is configured as the live server. However, if I put in any drive in this server for testing, I will break the RAID on this server. I am right on this??? If I have the RAID broken, will it be rebuild if I put the original drive back ??? If not, Anyone knows of anyway which I would add extra space on the os drive to the current live server ?

Many thanks

.
