Trevor

Have you installed the patches outlined in this KB?

<http://support.microsoft.com/kb/926505/en-us>

There are patches for the both the SBS server and the workstation.

Have you disabled/unchecked IPv6 networking pieces on the laptop. SBS doesn't use IPv6 (for now anyway)

You don't say what the error is that you're getting after starting the nshelp.exe

Hi Guys,

I have been running an SBS2003R2 premium network for some time now with XPpro workstations and with ISA2004SP3. All server and workstation updates are current through WSUSSP3.

I am now adding my fist Vista laptop and had no luck in attaching to the SBS domain using the prefered .\connectcomputer despite running the many KB articles for the server and vista workstation. I have also been through a diagnostics session with Jeff@TechSoEasy who is an emminent SBS guru. I can connect manually and have detached using the recommended procedure before attempting the rejoin (still with the same problem)

I see that others here have also had the same problem as myself and wondered what the Microsoft official position is regarding its fix. IE try to connectcomputer and get an error after nshelp.exe runs and starts to download files.

I am happy to provide as much information as is required to get to the bottom of this problem, as I'm frustrated by the lack of conclusions evident in other Q's relating to this matter.

Given that a fix is discovered I will post in the currently open Experts-Exchange.com session that has been running for some days now.
