On the member server, go to Control Panel | Windows Firewall | Exceptions and add the port you want to open. If you want to route requests from the internet to the member server on the port you will open, go to SBS Administrative Tools | Routing and Remote Access, click on 'IP Routing' | 'NAT/Basic Firewall', right click on 'Network Connection', select 'Properties', click 'Services and Ports', click 'Add' provide the port you open and under 'Private address' the IP of the member server.

Make sure you have the port open at the firewall as well

The router -> SBS2K3 Standard (2 NICs) -> Win2K3

Within SBS domain, there is the second server on which we need to open certain ports.

Is there any way to do that?

Thanks in advance

jack
