Hello John,

Thank you for posting here.

In answer to your questions:

1. You are right. <localdomainname> distribution group is used in Exchange. When users send emails to <localdomainname> distribution group, all the members receive the emails.
2. Yes, a) should be the member of 1,2,3.

Good

3. I am not sure what do you mean remote users. If the users connect to the server by VPN or dial in, they should be the member of Domain Users, mobile users. If ISA server is installed, they also should be the member of Internet Users.

ISA Not installed. These users only access the intranet. They connect from browser using <https://<domain>:444> They do nothing else (no RWW, No OWA and aren't Exchange or Domain Users. I'd like to remove these users from any groups that aren't appropriate to their requirement!

However, if I misunderstand you, please let me know.

4. I think group c) need 1), 2). In addition, if the remote users connect to the server by VPN or dial in, they should be the member of Mobile Users group and Internet Users group (If ISA server is installed.)

Re: Putting Users in Groups

ISA not installed. They aren't Mobile Users and do not connect via either VPN or dial-in. All they use is browser and <https://<domain>/remote> and then choose to connect to the application server. They do not require any other form of access (at this time!).

If anything is unclear, please feel free to let me know.

Best regards,

Manfred Zhuang(MSFT)
Microsoft Online Newsgroup Support

Get Secure! – www.microsoft.com/security

This newsgroup only focuses on SBS technical issues. If you have issues regarding other Microsoft products, you'd better post in the corresponding newsgroups so that they can be resolved in an efficient and timely manner. You can locate the newsgroup here:
<http://www.microsoft.com/communities/newsgroups/en-us/default.aspx>

When opening a new thread via the web interface, we recommend you check the "Notify me of replies" box to receive e-mail notifications when there are any updates in your thread. When responding to posts via your newsreader, please "Reply to Group" so that others may learn and benefit from your issue.

Microsoft engineers can only focus on one issue per thread. Although we provide other information for your reference, we recommend you post different incidents in different threads to keep the thread clean. In doing so, it will ensure your issues are resolved in a timely manner.

For urgent issues, you may want to contact Microsoft CSS directly. Please check <http://support.microsoft.com> for regional support phone numbers.

Any input or comments in this thread are highly appreciated.

|
| Following on from recent discussions I'm trying to put users into the
| correct security groups

|
| In reviewing our currently set up users, they all (apart from the
| Administrator) appear to be members of the following three groups:
|
| 1) Domain Users
| 2) Remote Web Workplace Users
| 3) <localdomainname>
|
| In fact, our users fall broadly into three groups:
|
| a) Local users (both static and mobile) who also require OWA
| b) Remote Users who only require Intranet Access
| c) Remote Users who require Application access via Terminal Services
| (and RWW)
|
| I'm not sure what 3) is! Documentation says its to do with
| Distribution Groups. Does this mean its about appearing in an Address
| Book?
|
| I assume it is correct for a) to have all of 1), 2) and 3) ?
|
| I'm unclear what group b) need to just get to our Intranet ?
|
| I gues its obvious group c) need 2) – but do they need 1) and 3) if
| their only requirement is to TS to the application ?
|
| I've printed out various help files and Security Groups listings but
| am finding it difficult to correlate the various lists, so any help
| appreciated!
