> When a user connects to the SBS server through the ptpp vpn connection, the client station cannot see other computers in the workgroup/domain. How can I enable that?

Browsing = netBIOS, and NetBIOS isn't routable. Browsing across a routed connection means either using WINS (set the WINS server IP in your VPN client config) or, more primitively, using LMHOSTs.

Neither of these is perfect and you may not always be able to browse. Do you really need to? Using a login script/batch file to map drives is easy enough....so is typing \\server\share in an address bar.

You mention a workgroup − why is there a workgroup on your company network?

.
