Hi Claus, thanks for your answer.

I have installed the sbs win2003 three times and always happens this problem.

Checking the Event Viewer found that there is a common mistake W32Time. I must confirm that Windows Time Service or another NTP Time Service is running and available on the source system.

I'll try to focus on this...Thank you!

What errors do you see in the event logs? When the users cannot connect any longer, can you log into the console without problems? If this always happens at the same time, check if there is any program that is scheduled to start at that time.

Hi,

The problem is that when users have worked ten hours lost connection to

Re: Users lose connection to the server after several hours

the

server win 2003 sb R2.

Then I have to restart the server so that users can work again.

This happens every day at the same time.

I thank all the people who can help me
