Troubleshooting works the best if one change is made, testing the result, and if it doesn't work, undo the change and try the next possible resolution.

What I would suggest is to put the second NIC back in (what are you running Standard/Premium/ISA?), run the CEICW, plug a workstation into the switch and power it up. Test the "connect computer" and if it doesn't work, post an ipconfig /all from the server and one of the workstations.

Hi NG

This is a very weird problem on a new setup.
The network:
DSL > Netgear wireless router > netgear switch.
Added the second NIC, one NIC and the wireless go to one hub, the 2nd NIC and the rest of the workstation sgo to the netgear switch.
NIC 1 / Wirless router – 192.168.16.1 and 2
NIC 2 192.168.44.1
Re-ran ICW after adding the second NIC, got no errors, everything looked fine.
Tried to add the first workstation to the domain, got prompted for a password, and after a tie out got:
Could not join the machine to the domain, the network path was not found.
I goggled the error, and all articles refer to the workstation as the problem. I do not think this is the case since the stations are new. So I tried to add one of the stations to the domain on my laptop, no problem! remove and try to the new domain, no luck.
Tried adding WINS server on the SBS setup, no luck.
Went back to single card setup, no luck.
Completely removed the dns, cleared the cache, re-installed DNS, no luck.
nslookup on the client brings the correct domain name, newbury.local
The machines get their IP from the SBS dhcp server.

Re: net work path not found when trying to add a mchine to domain

tried using the ComputerConnect, got no errors but the machine was not added.

What am I looking at and how do I resolve?

TIA
