I am trying to restore Small Business Server 2003 that had all the latest updates installed as of 1/1/08. However, I tried installing from the original SBS2003 disk stopping with the "continue setup" after the server rebooted. Installed necessary MB and NIC drivers. Installed SBS2003 SP1. Restored from the full backup (backed up entire system with windows NT backup including system state). For the restore I had it overwrite any files with restored files and in the advanced screen – had all 4 lines checked as I read in one of the discussions and the restore completed and seemed to go ok other than the warning about restoring to a server that does not have exchange running on it. But when I restarted the server, it will not boot but gives me the error something like unable to load dll to HAL or something like that – I thought I was missing another update relase but how do I get them if I cannot connect the server to the internet until I get it restored. I trying one more time from scratch right now. If you have any more suggestions, they would be greatly appreciated!! Thanks.

Also, there is the following, with is worth reviewing if you have not already:

download.microsoft.com/download/b/d/8/bd8e1a40-d202-429a-8eb7-26300d62bcc9/BKU_BkupRstr.doc

Good catch Merv!

I missed the SBS part of John's reply.

John... you're looking for Windows 2003 SP2. SBS 2003 SP2 doesn't exist. (See Larry's link).

Options:

Windows 2003 SP1 + SBS 2003 SP1
Windows 2003 SP2 + SBS 2003 SP1
Windows 2003 SP1 + SBS 2003 SP1, then install Windows 2003 SP2

IE in High Security Mode: add "*.microsoft.com" (no quotes) to trusted sites on the server or download Windows 2003 SP2 from a workstation.

I've looked all over Microsoft site (except the right place) where can I go to download SBS2003 SP2 on a separate computer than the server (ie at home)? Also, I tried adding microsoft update to the trusted sites with the box unchecked and all I get is the IE site - cannot find web page. If I just open IE I get the message that IE is in "high security mode". when I check the status - it says connected. Here is my setup:

Windows IP Configuration

Host Name : aahserver

"Larry Struckmeyer" wrote:

As I remember this, you need only the Windows Service Packs. Not updates, not application updates or service packs. You should be able to connect a computer to the internet and pull down Windows SP2, if that is what you are missing.

Re: Disaster Restore SBS2003

I had to resize the partitions
on my RAID1 array and
now I cannot
get the
backup restored. I followed
the article I found in other
threads
but I am
having a major problem. I
have reinstalled SBS to the
point the
server
restarts and wants me to
continue setup. I canceled
out of that
and
installed drivers for the MB
and 2nd NIC which shows
connected but
I cannot
access the internet because
IE is in "high security
mode" and will
not allow
access to any site that is not
https: which
update.microsoft is not
so how do
I get SBS to update to the
same level as my backup
when I cannot
connect to
the update site? I have disks
for sp1 which I installed but
I
cannot get any
more updates until I connect
to the update web site. I
tried
restoring
without the updates and it
does not work very well
